TECHNICAL SKILLS

Mobile:	React Native (7 yrs), Expo (EAS builds, OTA updates, dev client, managed & bare), App Store & Play Store releases, native modules (Swift/Expo Modules - iOS Live Activities), Mapbox, background location/GPS & geofencing, device sensors (barometer, GPS fusion), Reanimated & Gesture Handler, React Native Skia, HeroUI Native + Uniwind, MMKV & offline storage, camera/image/video pipelines, RevenueCat, Push Notifications, Deep Linking, PWA
Frontend:	React, Next.js, Astro, TypeScript, JavaScript (ES6+), TanStack (Start, Router, Query, Form, Table), TailwindCSS/NativeWind, Zustand, Redux Toolkit, React Hook Form, Zod, shadcn/ui, Framer Motion, i18next
Backend:	Convex, Node.js, Bun, Express, Hono, PostgreSQL, MongoDB, Firebase, Redis, tRPC, GraphQL, REST API design, Prisma, Drizzle, S3/MinIO, Resend, Svix webhooks, Turf.js geospatial
Auth:	Better Auth, Clerk, Supertokens, Firebase Auth, session/token patterns with expo-secure-store
Testing:	Maestro E2E, Vitest, Jest, React Testing Library, Cypress, Test-Driven Development
DevOps:	GitHub Actions (+ EAS custom jobs), Turborepo/pnpm & NX monorepos, Docker, Railway, Fly.io, Vercel, DigitalOcean, AWS (S3, CloudFront), Cloudflare
AI & Agentic:	Claude Code pipelines - git worktree isolation, parallel agent sessions, skills/memory docs layers - plus Claude, OpenAI, and Gemini APIs
Tools:	Git, Sentry, PostHog, ClickUp, Linear, Figma, Sanity CMS, Strapi CMS, Airtable/Notion/Asana API integrations

PROFESSIONAL EXPERIENCE

Senior Fullstack Engineer | RIDR GmbH

March 2026 - September 2026 | Remote (Germany-based startup)

One of two engineers building a community-driven mountain biking app in React Native, Expo, TypeScript, and Convex. Brought 7 years building software, 5 of them in production React Native, and shipped the full product surface, from progression systems and the social feed to the Explore map and the Convex backend, taking each feature from scoped ticket to App Store release.

- Took the app to 4,500+ riders and 3,000+ monthly actives within three months of the June 2026 launch, doubling monthly actives from June to August with 5,000+ GPS ride sessions tracked and 1,800+ rides recorded. Shipped 19 production releases at a roughly weekly cadence, each gated by tests, type checks, and lint in CI
- Drove the ride-upload failure rate from 48% to under 1% with idempotent client-ID uploads, duplicate-session dedup, and a crash-recovery flow that restored 146 interrupted rides. Hardened GPS accuracy with stationary-drift gating and sustained-window speed measurement
- Designed the team's agentic delivery pipeline: git worktree isolation, parallel cloud and on-device Claude sessions across 2-3 concurrent simulators, and stakeholder requests decomposed into agent-scoped tasks on a ClickUp board wired into CI. Personally landed 1,200+ commits across 167 PRs in six months
- Built the trail system end-to-end: bulk OpenStreetMap MTB-trail import with automated classification, elevation enrichment from AWS Terrain Tiles, and interactive review tooling, plus ride-session trail tracking that matches live GPS rides to trail segments for per-run Trail Records. The system powers the Explore surface used by 77% of monthly actives
- Architected the codebase for AI-agent reliability, with stable module boundaries and a shared skills/memory docs layer loaded by every agent session. Kept generated code consistent and eliminated repeated instruction as agentic usage scaled

Senior Full Stack Engineer | Smash Creative

March 2021 - January 2026 | Remote

Built and maintained mobile apps and internal tools as lead engineer across all codebases.

Burn by Cara Loren: fitness subscription app with \$1.3M+ lifetime revenue and 45K+ downloads, built for an influencer with 2M+ followers.

- Designed and built an automated retention pipeline that reduced daily churn by 9%, using RevenueCat webhooks to detect trial conversions, Redis-based duplicate prevention, and Scribeless API integration for physical thank-you letters
- Designed a goal-based progression engine with distinct difficulty curves for build muscle, lose weight, and stay active goals, contributing to 24% MRR growth (from \$22.8K to \$28.2K) over 3 months
- Reduced the app crash rate 69%, from 2.9 to 0.9 crashes per day, through Sentry integration, error boundaries, and systematic bug fixes
- Built the CI/CD pipeline with GitHub Actions: test and typecheck gates that block production deploys, tag-based staging and production releases, hourly database backups with 24-file retention, and Slack alerts on failure
- Led a zero-downtime migration from Strapi to Sanity CMS: wrote the data migration scripts, kept the app stable through cutover, and enabled the content team to ship workout updates without engineering tickets
- Executed 3 major Expo SDK upgrades (50 to 52) including React Native 0.74 to 0.76 and breaking API migrations, maintaining app stability while adopting new platform features

Other Smash Creative Projects

- Built an affiliate analytics mobile app from scratch in React Native and Expo: Victory Charts dashboards, session-based auth with expo-secure-store, PWA support, and CI/CD deployment to DigitalOcean (207 commits)

- Inherited and modernized the internal project management dashboard: replaced the legacy charting library (335 lines down to 86), added Clerk authentication and Vitest testing, and integrated Asana and Harvest APIs for real-time project tracking
- Built an Instagram lead-scraping pipeline with Apify: Prisma/PostgreSQL storage, batch CSV processing, and Airtable sync for influencer outreach campaigns
- Onboarded and coordinated 3-4 contractors across projects, maintained codebase continuity through team transitions, and established patterns and documentation for faster ramp-up

Software Developer | V School (Contract)

May 2024 - September 2024 | Remote

Built features for V Hub, the school's internal learning management system.

- Optimized the Airtable-to-Firestore sync from minutes to 3 seconds with batch writes, Promise.allSettled error handling, and a refactored async data flow
- Built a job application tracking system with Redux: weekly goal visualization, submission forms, and progress metrics that help students track their search
- Built student management features for the admin dashboard, including a searchable DataTable with sorting and filtering, student navigation, and report card views
- Migrated the codebase from moment.js to dayjs and upgraded the Nx monorepo through 3 major versions, reducing bundle size and improving maintainability
- Implemented a Firebase caching layer for the Notion API with a 24-hour TTL, reducing external calls while keeping data fresh

Front-End Developer | Freelance

February 2019 - March 2021 | Remote

- Built the event registration and payment platform for the Governor of New Jersey's 2022 Inaugural Ball (a side project while at Smash Creative), integrating the Jotform API with Authorize.net payment processing to handle 500+ registrations
- Built a React portfolio showcase site for Media Solutions of New York, a video production company
- Built Blitz Reader, a Chrome extension for speed-reading web page text

PROJECTS

Commit Analyzer - Git History Analysis Tool

TypeScript, Bun, Claude/Gemini/OpenAI APIs

- CLI tool analyzing git commit history using LLMs to generate insights, documentation, and codebase summaries

EDUCATION & TRAINING

theSeniorDev - Senior Developer Mentorship Program (2022-2023)

Advanced system design, architecture patterns, and career development

V School - Full Stack JavaScript Certification (2020-2021)

MERN stack, React, Node.js, MongoDB

General Assembly - Web Development Immersive (2018-2019)

Full-stack fundamentals, JavaScript, Ruby on Rails

ADDITIONAL

- Languages: English (native)
- Work Authorization: US Citizen - no sponsorship needed; work async with US/EU teams from UTC+7
