TECHNICAL SKILLS

Mobile:	React Native (7 yrs), Expo (EAS builds, OTA updates, dev client, managed & bare), App Store & Play Store releases, native modules (Swift/Expo Modules - iOS Live Activities), Mapbox, background location/GPS & geofencing, device sensors (barometer, GPS fusion), Reanimated & Gesture Handler, React Native Skia, HeroUI Native + Uniwind, MMKV & offline storage, camera/image/video pipelines, RevenueCat, Push Notifications, Deep Linking, PWA
Frontend:	React, Next.js, Astro, TypeScript, JavaScript (ES6+), TanStack (Start, Router, Query, Form, Table), TailwindCSS/NativeWind, Zustand, Redux Toolkit, React Hook Form, Zod, shadcn/ui, Framer Motion, i18next
Backend:	Convex, Node.js, Bun, Express, Hono, PostgreSQL, MongoDB, Firebase, Redis, tRPC, GraphQL, REST API design, Prisma, Drizzle, S3/MinIO, Resend, Svix webhooks, Turf.js geospatial
Auth:	Better Auth, Clerk, Supertokens, Firebase Auth, session/token patterns with expo-secure-store
Testing:	Maestro E2E, Vitest, Jest, React Testing Library, Cypress, Test-Driven Development
DevOps:	GitHub Actions (+ EAS custom jobs), Turborepo/pnpm & NX monorepos, Docker, Railway, Fly.io, Vercel, DigitalOcean, AWS (S3, CloudFront), Cloudflare
AI & Agentic:	Claude Code pipelines - git worktree isolation, parallel agent sessions, skills/memory docs layers - plus Claude, OpenAI, and Gemini APIs
Tools:	Git, Sentry, PostHog, ClickUp, Linear, Figma, Sanity CMS, Strapi CMS, Airtable/Notion/Asana API integrations

PROFESSIONAL EXPERIENCE

Senior Fullstack Engineer | RIDR GmbH

March 2026 - Present | Remote (Germany-based startup)

One of two engineers building a community-driven cycling app - React Native, Expo, TypeScript, Convex - bringing 7 years of production React Native experience and shipping the full product surface (progression systems, social feed, Explore map, Convex backend) end-to-end from scoped ticket to App Store release; currently shipping the app's Pro subscription tier.

- Took the app from private beta to 4,500+ riders and 3,000+ monthly actives within three months of the June 2026 launch - 2x monthly-active growth June->August, 5,000+ GPS ride sessions tracked, 1,800+ rides recorded - shipping 19 production releases at a roughly weekly cadence, each gated by Maestro E2E suites in CI
- Drove ride-upload failure rate from 48% to under 1% - idempotent client-ID uploads, duplicate-session dedup, and crash recovery that restored 146 interrupted rides - while hardening GPS accuracy with stationary-drift gating, elevation hysteresis, and sustained-window speed measurement
- Designed the team's agentic delivery pipeline - git worktree isolation, parallel cloud and on-device Claude sessions, 2-3 concurrent simulators, stakeholder requests decomposed into agent-scoped tasks on a ClickUp board wired into CI - personally landing 1,200+ commits across 167 PRs in six months
- Built the trail system end-to-end - bulk OpenStreetMap MTB-trail import (automated classification, elevation enrichment from AWS Terrain Tiles, interactive review tooling) plus ride-session trail tracking that matches live GPS rides to trail segments for per-run Trail Records - powering the Explore surface used by 77% of monthly actives
- Architected the codebase for AI-agent reliability - stable module boundaries and a shared skills/memory docs layer loaded by every agent session - keeping generated code consistent and eliminating repeated instruction as agentic usage scaled
- Serve as production escalation point - Sentry monitoring across four projects - e.g. diagnosing an iOS Live Activity crash (6,800+ events) and shipping the fix in one release cycle

Senior Full Stack Engineer | Smash Creative

March 2021 - January 2026 | Remote

Built and maintained mobile apps and internal tools as lead engineer across all codebases.

Burn by Cara Loren - Fitness subscription app (\$1.3M+ lifetime revenue, 45K+ downloads) for an influencer with 2M+ followers.

- Designed and built automated retention pipeline - RevenueCat webhooks detecting trial conversions, Redis-based duplicate prevention, and Scribeless API integration for physical thank-you letters - reducing daily churn by 9%
- Designed goal-based progression engine - distinct difficulty curves for build muscle, lose weight, and stay active goals - contributing to 24% MRR growth (\$22.8K -> \$28.2K) over 3 months
- Reduced app crash rate 69% (2.9/day -> 0.9/day) through Sentry integration, error boundaries, and systematic bug fixes - improving stability and user retention
- Built CI/CD pipeline with GitHub Actions - test/typecheck gates blocking production deploys, tag-based staging/production releases, hourly database backups with 24-file retention, Slack alerts on failure
- Led zero-downtime migration from Strapi to Sanity CMS - wrote data migration scripts, maintained app stability during cutover, enabled content team to ship workout updates without engineering tickets
- Executed 3 major Expo SDK upgrades (50->51->52) including React Native 0.74->0.76 and breaking API migrations - maintaining app stability while adopting new platform features

Other Smash Creative Projects

- Built affiliate analytics mobile app from scratch - React Native/Expo, Victory Charts dashboards, session-based auth with expo-secure-store, PWA support, and CI/CD deployment to DigitalOcean (207 commits)

- Inherited and modernized internal project management dashboard - replaced legacy charting library (335->86 lines), added Clerk authentication, Vitest testing, and integrated Asana/Harvest APIs for real-time project tracking
- Built Instagram lead scraping pipeline with Apify integration - Prisma/PostgreSQL storage, batch CSV processing, and Airtable sync for influencer outreach campaigns
- Onboarded and coordinated 3-4 contractors across projects, maintained codebase continuity through team transitions, established patterns and documentation for faster ramp-up

Software Developer | V School (Contract)

May 2024 - September 2024 | Remote

Built features for V Hub, the school's internal learning management system.

- Optimized Airtable-to-Firestore sync from minutes to 3 seconds - batch writes, Promise.allSettled for resilient error handling, refactored async data flow
- Built job application tracking system with Redux - weekly goal visualization, submission forms, and progress metrics helping students track their job search
- Built student management features for admin dashboard - searchable DataTable with sorting/filtering, student navigation, and report card views
- Migrated codebase from moment.js to dayjs and upgraded Nx monorepo through 3 major versions - reducing bundle size and improving maintainability
- Implemented Firebase caching layer for Notion API with 24-hour TTL - reducing external calls while maintaining data freshness

Front-End Developer | Freelance

February 2019 - March 2021 | Remote

- Built event registration and payment platform for Governor of NJ Inaugural Ball - Jotform API + Authorize.net, 500+ registrations
- Built portfolio showcase site for Media Solutions of New York - React-based video production company website
- Built Blitz Reader Chrome extension - speed reading tool for web page text

PROJECTS

Commit Analyzer - Git History Analysis Tool

TypeScript, Bun, Claude/Gemini/OpenAI APIs

- CLI tool analyzing git commit history using LLMs to generate insights, documentation, and codebase summaries

EDUCATION & TRAINING

theSeniorDev - Senior Developer Mentorship Program (2022-2023)

Advanced system design, architecture patterns, and career development

V School - Full Stack JavaScript Certification (2020-2021)

MERN stack, React, Node.js, MongoDB

General Assembly - Web Development Immersive (2018-2019)

Full-stack fundamentals, JavaScript, Ruby on Rails

ADDITIONAL

- Languages: English (native)
- Work Authorization: US Citizen - no sponsorship needed; work async with US/EU teams from UTC+7
